0011b – PAGE3	0111b – PAGE7	1011b – PAGE11																					
											E[7:0] : Dummy byte (Set as 00h)												
											F[6:0] : Define the start column address (RESET = 00h)												
											G[6:0] : Define the end column address (RESET = 7Fh)												
											<b>Note</b> (1) The value of D[3:0] must be larger than or equal to B[3:0]  (2) The value of G[6:0] must be larger than F[6:0]  (3) A delay time of $2/FrameFreq$ must be set if sending the command of 2Ch / 2Dh consecutively.												

#### Note

(1) “\*” stands for “Don’t care”.

## 1.1 Graphic Acceleration Command

### 1.1.1 Horizontal Scroll Setup (26h/27h)

This command consists of seven consecutive bytes to set up the horizontal scroll parameters and determines the scrolling start page, end page, scrolling speed, start column and end column.

Before issuing this command the horizontal scroll must be deactivated (2Eh). Otherwise, RAM content may be corrupted.

The SSD7317 horizontal scroll is designed for 128 columns scrolling. The following figures (Figure 0-1, Figure 0-2, and Figure 0-3) show the examples of using the horizontal scroll:

**Figure 0-1 : Horizontal scroll example: Scroll RIGHT by 1 column**

Original Setting	SEG0	SEG1	SEG2	SEG3	SEG4	SEG5	...	...	...	SEG122	SEG123	SEG124	SEG125	SEG126	SEG127
After one scroll step	SEG127	SEG0	SEG1	SEG2	SEG3	SEG4	...	...	...	SEG121	SEG122	SEG123	SEG124	SEG125	SEG126

**Figure 0-2 : Horizontal scroll example: Scroll LEFT by 1 column**

Original Setting	SEG0	SEG1	SEG2	SEG3	SEG4	SEG5	...	...	...	SEG122	SEG123	SEG124	SEG125	SEG126	SEG127
After one scroll step	SEG1	SEG2	SEG3	SEG4	SEG5	SEG6	...	...	...	SEG123	SEG124	SEG125	SEG126	SEG127	SEG0

**Figure 0-3 : Horizontal scrolling setup example**

### 1.1.2 Continuous Vertical and Horizontal Scroll Setup (29h/2Ah)

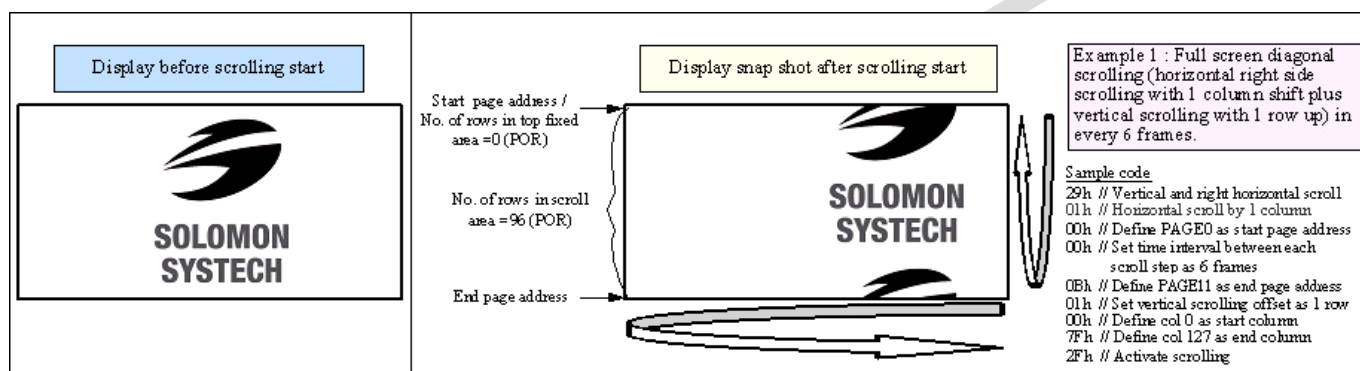

This command consists of seven consecutive bytes to set up the continuous vertical scroll parameters and determine the scrolling start page, end page, start column, end column, scrolling speed, horizontal and vertical scrolling offset.

If the vertical scrolling offset byte E[6:0] of command 29h / 2Ah is set to zero, then only horizontal scrolling is performed (like command 26h/27h). On the other hand, if the number of column scroll offset byte A[0] is set to zero, then only vertical scrolling is performed.

Continuous diagonal (horizontal + vertical) scrolling would be enabled if both A[0] and E[6:0] are set to be non-zero, whereas full column diagonal scrolling mode is suggested by setting F[6:0]=00h and G[6:0]=7Fh.

Before issuing this command the scroll must be deactivated (2Eh), or otherwise, RAM content may be corrupted. The following figure (Figure 0-4) show the examples of using the continuous vertical and horizontal scroll.

**Figure 0-4 : Continuous Vertical and Horizontal scrolling setup example**

### 1.1.3 Deactivate Scroll (2Eh)

This command stops the motion of scrolling. After sending 2Eh command to deactivate the scrolling action, the ram data needs to be rewritten.

### 1.1.4 Activate Scroll (2Fh)

This command starts the motion of scrolling and should only be issued after the scroll setup parameters have been defined by the scrolling setup commands: 26h / 27h / 29h / 2Ah. The setting in the latest scrolling setup command overwrites the setting in the previous scrolling setup command.

The following actions are prohibited after the scrolling is activated

1. RAM access (Data write or read)
2. Changing the horizontal scroll setup parameters

### 1.1.5 Set Vertical Scroll Area (A3h)

This command consists of 3 consecutive bytes to set up the vertical scroll area. For the continuous vertical scroll function (command 29h / 2Ah), the number of rows in the vertical scroll area can be set smaller than or equating to the MUX ratio. Figure 0-5 shows a vertical scrolling example with different settings in vertical scroll area.

**Figure 0-5 : Vertical scroll area setup examples**

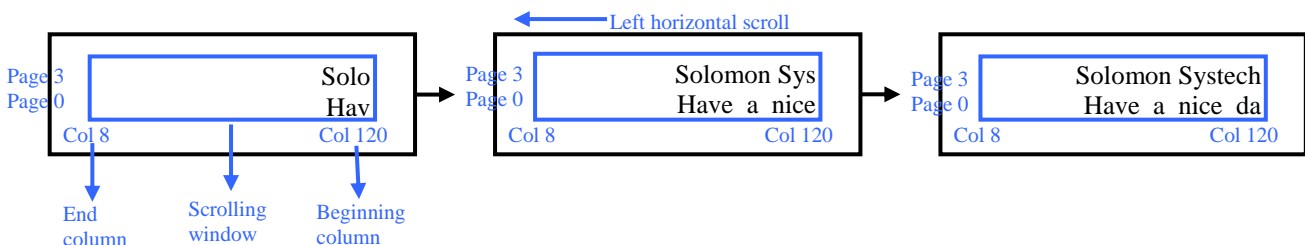

## 1.2 Advance Graphic Acceleration Command

### 1.2.1 Content Scroll Setup (2Ch/2Dh)

This command consists of seven consecutive bytes to set up the horizontal scroll parameters and determine the scrolling start page, end page, start column and end column. One column will be scrolled horizontally by sending the setting of command 2Ch / 2Dh once.

When command 2Ch / 2Dh are sent consecutively, a delay time of  $\frac{2}{FrameFreq}$  must be set. Figure 0-6 shown an example of using 2Dh “Content Scroll Setup” command for horizontal scrolling to left with infinite content update. In there, “Col” means the graphic display data RAM column.

**Figure 0-6: Content Scrolling example (2Dh, Left Horizontal Scroll by one column)**

By using command 2Ch/2Dh, RAM contents are scrolled and updated by one column. Table 0-1 is an example of content scrolling setting of SSD7317 (eg. scrolling window of 4 pages). The values of registers depend on different conditions and applications.

**Table 0-1 : Content Scrolling software flow example (Page addressing mode – command 20h, 02h)**

Step	Action	D/C#	Code	Remarks
1	<b>For i= 1 to n</b>	-	-	Create “For loop” for infinite content scrolling
2	Set Content scrolling command (scrolling window : Page 0 to 3, Col 8 to Col 120)	0 0 0 0 0 0 0 0	2Dh 00h 00h 01h 03h 00h 08h 78h	Left Horizontal Scroll by one column A[7:0] : Dummy byte (Set as 00h) B[3:0] : Define start page address C[7:0] : Set no wrap around of RAM content D[3:0] : Define end page address E[7:0] : Dummy byte (Set as 00h) F[6:0] : Define start column address G[6:0] : Define end column address
3	Add Delay time of $2/FrameFreq$	-	-	E.g. Delay 20ms if frame freq $\approx$ 100Hz
4	Write RAM on the beginning column of the scrolling window			
	Write RAM on (Page0, Col 120) <i>(Content update in beginning column)</i>	0 0 0 1	B0h 17h 08h -	Set Page Start Address for Page Addressing Mode Set Higher Column Start Address for Page Addressing Mode Set Lower Column Start Address for Page Addressing Mode Write data to fill the RAM
	Write RAM on (Page1, Col 120) <i>(Content update in beginning column)</i>	0 0 0 1	B1h 17h 08h -	Set Page Start Address for Page Addressing Mode Set Higher Column Start Address for Page Addressing Mode Set Lower Column Start Address for Page Addressing Mode Write data to fill the RAM
	Write RAM on (Page2, Col 120) <i>(Content update in beginning column)</i>	0 0 0 1	B2h 17h 08h -	Set Page Start Address for Page Addressing Mode Set Higher Column Start Address for Page Addressing Mode Set Lower Column Start Address for Page Addressing Mode Write data to fill the RAM
	Write RAM on (Page3, Col 120) <i>(Content update in beginning column)</i>	0 0 0 1	B3h 17h 08h -	Set Page Start Address for Page Addressing Mode Set Higher Column Start Address for Page Addressing Mode Set Lower Column Start Address for Page Addressing Mode Write data to fill the RAM
5	<b>i=i+1</b>	-	-	Go to next “For loop”
	<b>Delay timing</b>	-	-	Set time interval between each scroll step if necessary
	<b>End</b>			

There are 3 different memory addressing mode in SSD7317: COM-page H mode, Page addressing mode and SEG-page H mode and it is selected by command 20h. Table 0-1 is an example of content scrolling software flow under page addressing mode, while COM-page H mode example is shown in below Table 0-2.

**Table 0-2 : Content Scrolling setting example (COM-page H mode – command 20h, 01h)**

Step	Action	D/C#	Code	Remarks
1	<b>For i= 1 to n</b>	-	-	Create “For loop” for infinite content scrolling
F	Set Content scrolling command (scrolling window : Page 0 to 3, Col 8 to Col 120)	0	2Dh	Left Horizontal Scroll by one column
		0	00h	A[6:0] : Dummy byte (Set as 00h)
		0	00h	B[3:0] : Define start page address
		0	01h	C[7:0] : Set no wrap around of RAM content
		0	03h	D[3:0] : Define end page address
		0	00h	E[6:0] : Dummy byte (Set as 00h)
		0	08h	F[6:0] : Define start column address
		0	78h	G[6:0] : Define end column address
3	Add Delay time of $2/FrameFreq$	-	-	E.g. Delay 20ms if frame freq $\approx$ 100Hz
4	Write RAM on the beginning column of the scrolling window (Page 0 to 3, Col 120) <i>(Content update in beginning column)</i>	0	21h	Set Column address
		0	78h	Set column start address for Vertical Addressing Mode
		0	78h	Set column end address for Vertical Addressing Mode
		0	22h	Set Page address
		0	00h	Set start page address for Vertical Addressing Mode
		0	03h	Set end page address for Vertical Addressing Mode
		1	-	Write data to fill the RAM
5	<b>i=i+1</b>	-	-	Go to next “For loop”
	<b>Delay timing</b>	-	-	Set time interval between each scroll step if necessary
	<b>End</b>
